

LIQUIGUARD PC

REVOLUTIONARY PRE-TREATMENT FOR POWDER COATING

Eco - Friendly Pre-treatment for the Powder Coating Industry

Liquiguard PC is an unprecedented pre-treatment that is revolutionizing the way in which the powder coating industry prepares the substrates for coating. **Liquiguard PC** creates an extraordinary bond with the metal and produces a much smoother and glossier paint finish than traditional pre-treatments which tend to pit the metal surface. **Liquiguard PC** is also a strong rust inhibitor and thus an excellent replacement for the toxic and bio-hazardous phosphates and chromates.

Liquiguard PC allows powder coating shops to offer their services to a broader market segment due to **Liquiguard PC's** applicability to most metals including steel, steel alloys, galvanized steel, aluminum, manganese, brass, etc. Actual usage has also shown that **Liquiguard PC** is instrumental in the control of out-gassing in softer metals such as aluminum. This versatile pre-treatment is also an excellent primer for hot-dip galvanized surfaces and for liquid paints on hard to coat metals and composite materials.

Key Properties:

- 100% Water Based
- Extra-Ordinary Adhesion
- Excellent Rust Inhibition
- Versatile Pre-treatment and Primer
- Non-Toxic, Non-Flammable
- High Yield and Long Shelf Life
